

# **Intro to Photography: Session 2**

# **5 MINUTE REVIEW**

# Detail from a 12x18 @ 240 PPI

\*Images not shown to scale.

a. 10 PPI  
120px X 180px

b. 50 PPI  
600px X 900px

c. 240 PPI  
2880px X 4320px

Increasing Dots Per Inch

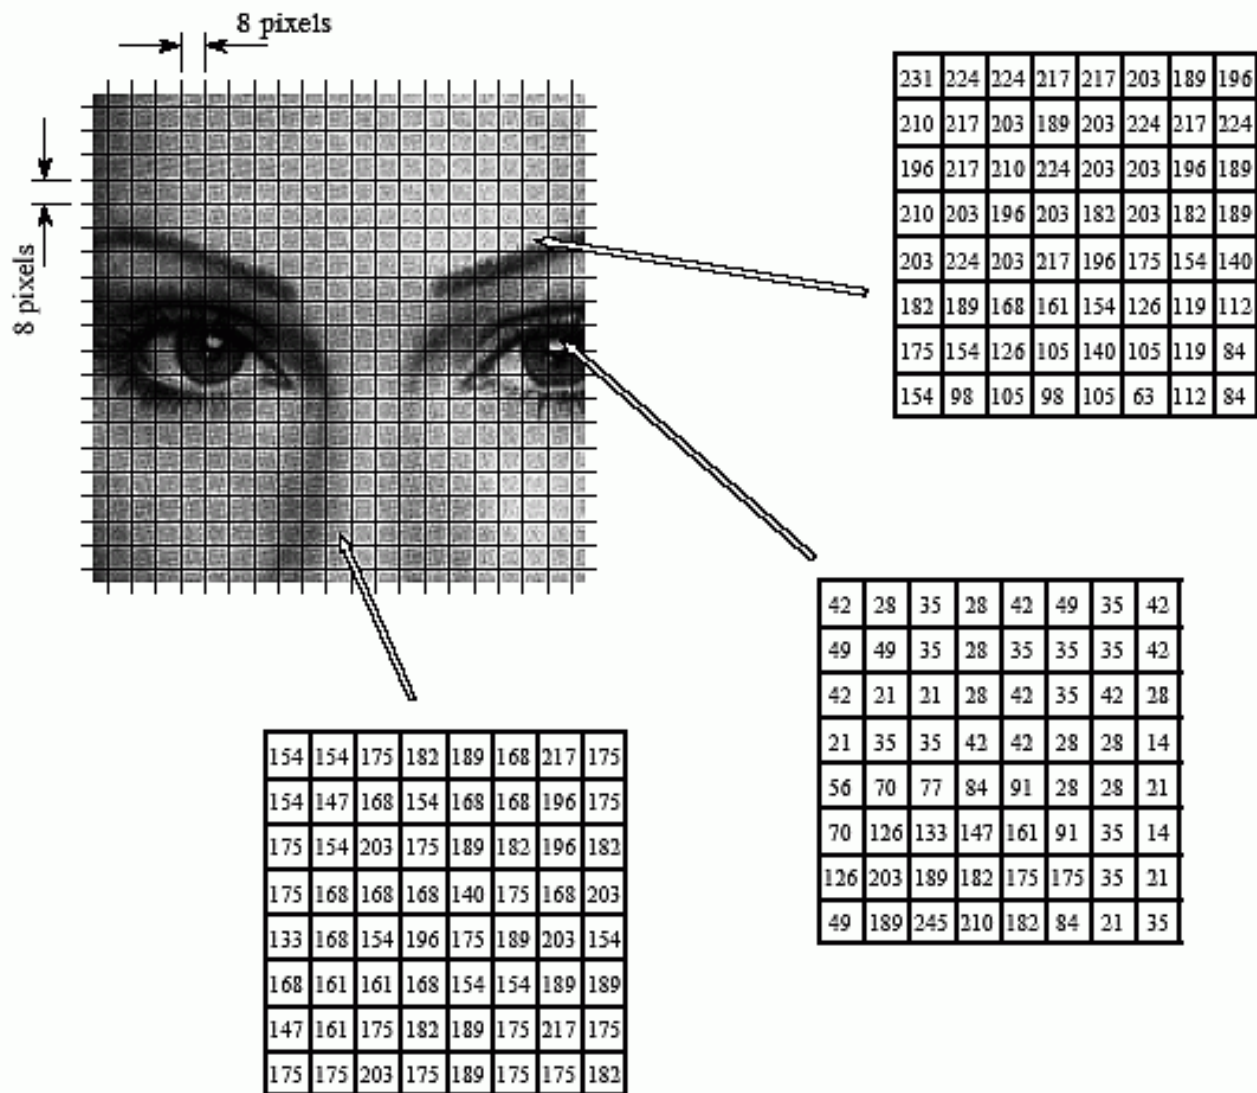

FIGURE 27-9  
 JPEG image division. JPEG transform compression starts by breaking the image into 8×8 groups, each containing 64 pixels. Three of these 8×8 groups are enlarged in this figure, showing the values of the individual pixels, a single byte value between 0 and 255.

16mm lens

35mm lens

70mm lens

150mm lens

All taken at the same aperture

## Depth of Field

**Telling Story with Perspective**

**\*\*\* Normal Lens is Determined by Sensor Size**

# LENS FOCAL LENGTH

# Lens Coverage

For new **digital cameras**, a bigger **sensor area** captures better quality, but requires larger diameter, bulkier lenses. To **optimize** the size of a serious **travel camera**, consider **1-inch Type sensor** or up to **APS-C sensor size**.

Full-frame sensor (Nikon FX, Canon EF, Sony FE) = **36 mm wide**

**"Full-frame 35mm"** sensor / film size (36 x 24 mm) is a standard for comparison, with a **diagonal field-of-view crop factor** = 1.0

*In comparison, a pocket camera's 1/2.5" Type sensor crops the light gathering by 6.0x smaller diagonally (with a surface area 35 times smaller than full frame).*

**APS-C** Nikon DX, Sony E = **1.5x crop**

**APS-C** Canon EF-S = **1.6x crop**

**Four Thirds** 4/3" = **2x crop**

**1" Type** = **2.7x crop**  
Sony RX10, RX100

**1/1.7": 4.6x**

**1/2.5":  
6.0x crop**

24 mm

"Medium format" size 48 x 36 mm

*Compact & pocket zoom cameras have small, noisy sensors, tiny enough to extend superzoom lens reach.*

*APS-C sensor gathers 15 times more light (area) than a 1/2.5" Type sensor, and 2.4 times less than Full Frame.*

# **Continuous vs Single vs Manual Focus**

# Continuous vs Single vs Manual Focus

---

- **In continuous focus the camera will continually focus wherever the selected focus sensor is aimed**
  - Good for action or subjects that are constantly moving
- **Single focus will activate and lock on a subject as long as the shutter release button is half pressed**
  - Best for relatively stationary subjects
- **Manual Focus - You physically set where the camera is focused.**
  - For most photographers, they should not use this setting.
  - Best for VERY stationary subjects, scientific or macro photography.

# **Focal Length Examples**

There is only  
one moment  
in time  
when it is  
essential to awaken  
that moment is  
NOW
